Considering the arrival time and burst time requirement of the process the scheduler schedules the processes by interrupting the processor after every 6 units of time and does consider the completion of the process in this iteration. The scheduler than checks for the number of process waiting for the processor and allots the processor to the process but interrupting the processor every 10 unit of time and considers the completion of the processes in this iteration. The scheduler checks the number of processes waiting in the queue for the processor after the second iteration and gives the processor to the process which needs more time to complete than the other processes to go in the terminated state. The inputs for the number of requirements, arrival time and burst time should be provided by the user.

1. Problem in terms of Operating System

OS scheduler project This project was to develop a CPU scheduler using below scenarios compute the scheduler performance by providing the waiting time for process, turnaround time for process and average waiting time and turnaround time.

2. Algorithm

Input of arrival time ,burst time ,time quantum

!
^ then
scheduling
!
^ then

output Total turnaround time and waiting time calculated then average waiting time and average turnaround time

3. Complexity of Algorithm

Complexicity=O(n)

5. Boundary Conditions

- a) Number of processes should be positive.
- b) Arrival time and burst time should be greater than 0.

6. Test Cases

Student ID:11715418

Email Address: sumankumar21041999@gmail.com

GitHub Link: https://github.com/achuara/os-projrct.git

Test Case 1: Enter number of processes greater than 0.Output: Program will run.

II. Test Case 2: Enter number of processes less than 0.Output: Program will terminate.

III. Test Case 3: Enter arrival time greater than 0.Output: Program will run.

IV. Test Case 4: Enter arrival time less than 0.Output: Program will terminate.

V. **Test Case 5:** Enter burst time greater than 0. **Output:** Program will run.

VI. Test Case 6: Enter burst time less than 0. Output: Program will terminate.

VII. Test Case 7: Enter the number of processes =3

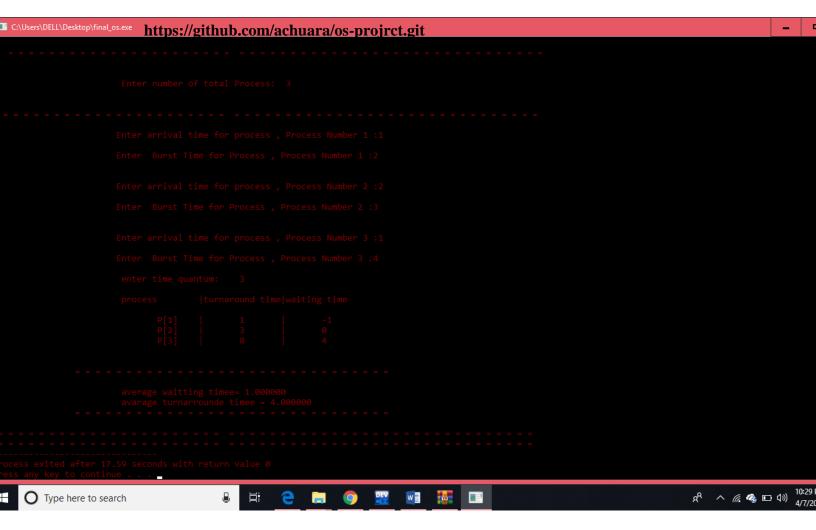

Student ID:11715418

Email Address: sumankumar21041999@gmail.com
